ZENFLEX™

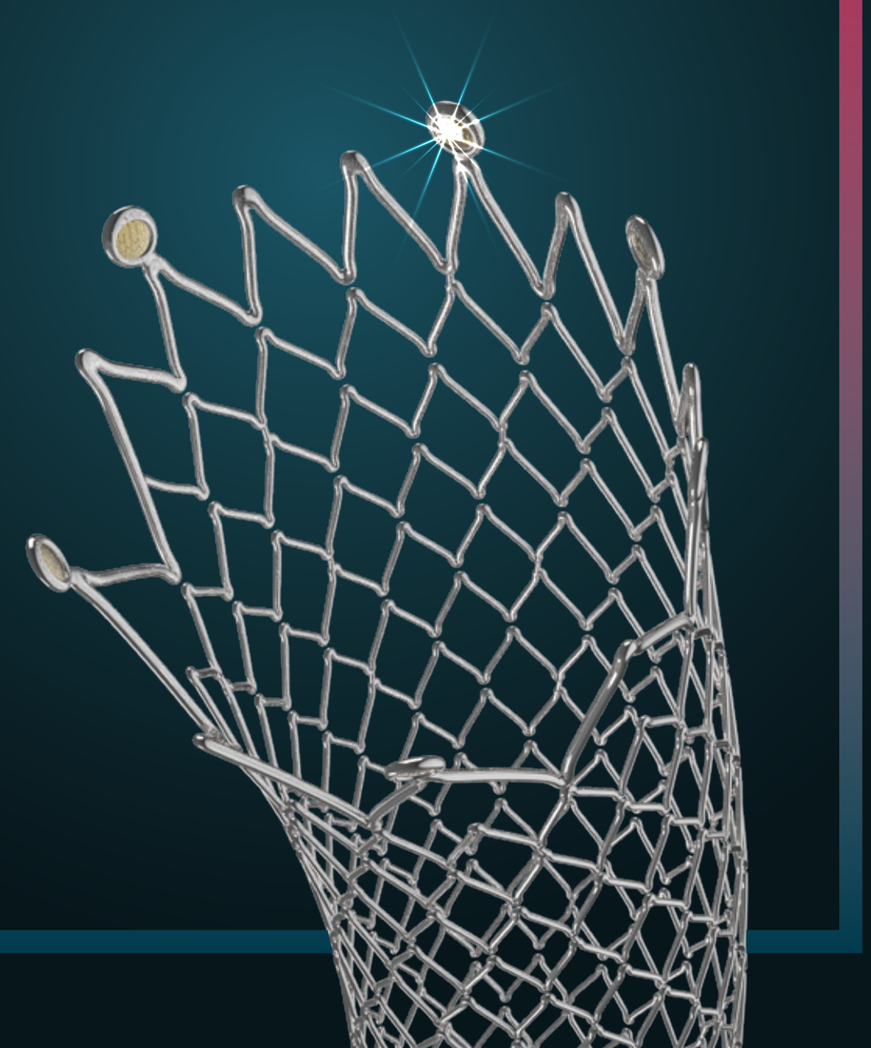
Peripheral Stent System



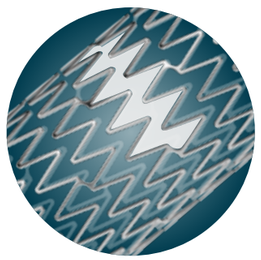
Peripheral Stent System

Superior Stent Performance

The ZENFLEX™ Peripheral Stent is a laser-cutting Nitinol self-expanding stent. Its superior performance is assured by optimal helical stent design combined with Micromesh design.

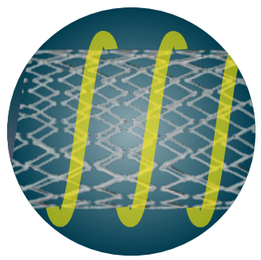
Micromesh design

- High radial strength and good fracture resistance
- To maximize vessel patency by decreasing tissue prolapse



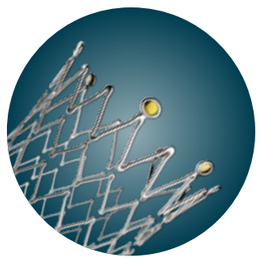
Unique Helical Design

- Excellent flexibility
- Superior vascular compliance
- High radial support strength



Gold/Tantalum Marker

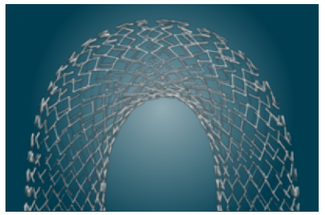
- 6 embedded micro markers at each end of the stent
- Accurately mark stent ends out and enhance visibility



Controlled Release System

- One-handed stent deployment
- The initial precise positioning followed by well matching quick release
- Ergonomic handle with anti-skid tuning dial combines comfortable hand feel and placement accuracy
- Guidewire acceptance 0.035"

Optimal Flexibility

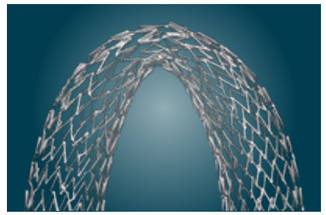


ZYLOX

The stent is flexible, and both radial force and rate of fracture(<1%) are good, which ensure blood flowing smoothly.

Competitor A

The radial force of the stent is weak and rate of fracture is in the middle level(5-7%). The stent has large lacuna and strong stimuli to vessel wall.



Competitor B

The stent is not flexible with rate of fracture (11-15%), and blood will be hindered in the bending site.
